

EXPLORATORY DATA ANALYSIS (EDA)

- Understand the data
- Summarize main characteristics
- Discover patterns & anomalies
- Prepare for deeper analysis

DATA ANALYTICS

Data Analytics is the process of exploring data, discovering patterns, and transforming it into meaningful business insights.

ADVANCED ANALYTICS

- Extract business insights
- Identify trends & performance
- Segment & compare
- Support decision making

EXPLORATORY DATA ANALYSIS (EDA)

- 
Database Exploration
Explore tables, columns, data types, and basic statistics.
- 
Dimension Exploration
Explore categorical dimensions, unique values, and distributions.
- 
Date Exploration
Analyze date ranges, frequencies, and time patterns.
- 
Measures Exploration
Summarize measures using aggregations (SUM, AVG, COUNT, etc.).
- 
Magnitude Analysis
Rank by size to find top/bottom and big vs small values.
- 
Ranking Analysis
Rank dimension values based on a measure (Top N / Bottom N).

Goal: Understand the data and discover key characteristics before drawing business conclusions.

ADVANCED ANALYTICS

- 
Change-Over-Time Analysis
Analyze how measures change across different time periods.
- 
Cumulative Analysis
Analyze running totals and cumulative progress over time.
- 
Performance Analysis
Evaluate performance against targets, benchmarks, or goals.
- 
Part-to-Whole Analysis
Understand composition and contribution of parts to the whole.
- 
Data Segmentation
Group data into segments based on ranges or categories.
- 
Reporting & Dashboarding
Communicate insights effectively with reports and dashboards.

Goal: Extract meaningful insights, identify opportunities, and support data-driven decisions.

LEARNING PATH (RECOMMENDED ORDER)

PHASE 1 – EXPLORATORY DATA ANALYSIS (EDA)

PHASE 2 – ADVANCED ANALYTICS

Remember: First **understand your data** (EDA), then apply advanced techniques to **uncover insights** and drive better business outcomes.
